

SIOP Forecast Performance Dashboard

Business Objective :

Developed an interactive SIOP dashboard to analyze Revenue, Non-Revenue and CAPEX forecasts against actuals. Implemented lag-based forecast comparison, forecast accuracy, forecast bias and country-level performance analysis.

Data preparation:

- Imported Forecast and Actual datasets
- Created lag mapping (Resultant, Lag0, Lag1)
- Pivoted forecast measures
- Built fact and dimension tables
- Created relationships between dimensions and fact table

KPI's Developed :

- Revenue Forecast
- Non Revenue Forecast
- CAPEX Forecast
- Forecast Accuracy %
- Forecast Bias %
- Forecast Error

Key Insights:

- Forecast Accuracy: 66%
- Forecast Bias: -34%
- Country A contributes highest forecast revenue
- Forecast underestimates actual demand

Lag Selection Example

Lag0 represents the latest forecast snapshot available before the actual sales period. It is used to compare planned demand against actual business performance. Analyzing Lag0 helps measure forecast accuracy and identify forecasting gaps. This enables better demand planning and decision-making in the SIOP process.

Country Filter Example

Country A is the highest contributor across Revenue, Non-Revenue, and CAPEX forecasts. The dashboard indicates that the majority of forecasted business activity is concentrated in Country A compared to other countries. However, the Forecast Accuracy of 52.73% and Forecast Bias of -47.27% suggest that actual demand is significantly higher than forecasted values, indicating an under-forecasting trend. This highlights the need for improved demand planning and forecast refinement for Country A to better align forecasts with actual business performance.
